All applicants applying for a technical test position with Planit are required to complete a technical examination in the Planit office(s). This examination is *usually* a Selenium Webdriver exam only however if the applicants skills are primarily in another tool the exam can be split to cover the tool they are most experienced with **plus** a Selenium Webdriver component. Applicants must nominate if they require to complete the test with another tool before attending the interview, however it is Planit's preference that applicants complete the examination solely using Selenium Webdriver.

The interview focuses on the applicant's ability to develop a few working tests on a simple test web application using best practise approaches. The applicant will be supplied with a laptop with Eclipse and Visual Studio installed so either Java or C# can be selected, and depending on the language selected one of the following frameworks can be chosen: JUnit, TestNG, MS Test, NUnit.

The following reading material is suggested for applicants before attending:
